Topos Technologies releases version 3.2 of LabSpeed™ Laboratory Instrument Data Management software

LabSpeed[™] Data Management software provides a common platform for charting, reporting, exporting, archiving, and sharing results generated from all types of analytical instruments used in a laboratory, from benchtop and hand-held devices to multi-element analysis spectrometers and bio-tech instruments.

Marlborough, MA – January 17, 2008 – Topos Technologies announces the release of version 3.2 of its LabSpeed Data Management software. LabSpeed brings together data generated by different instruments in the laboratory into one common research and reporting environment. With advanced charting and custom reporting capabilities, analysts can easily access results saved by an instrument and design one-click solutions optimized for daily research, reporting and exporting requirements.

Version 3.2 adds advanced calculation features to the LabSpeed platform. The user can add custom fields to the instrument data and apply formulas that reference any part of the original instrument data. Simple correction factors can be applied or complex formulas that include logical, statistical, math, date-time and string functions may be entered using LabSpeed's new FormulaBuilderTM interactive guide. All calculated results are available for reporting, charting and exporting.

LabSpeed provides chart, report and table end-user designers that allow the analyst to solve most common data handling problems found in the laboratory, such as creating specialized data formats for export to LIMS and creating custom reports to satisfy strict regulatory requirements. Now, with version 3.2, analysts can apply formulas to the data for data review and research. At the instrument, LabSpeed acts as an extension of the original analytical software application for process monitoring, reporting, calculating and previewing results before exporting to LIMS. In the office, LabSpeed accesses the stored data for each instrument in the laboratory for research and advanced analysis.

Founded in 2004, Topos Technologies is a software development company focused on solving data management problems in the analytical lab. Topos works with instrumentation companies who require state-of-the-art data management for their customers' processes, including data security, data research, data exporting, and data

presentation. Topos contracts directly to laboratories to provide customized solutions for factory automation and real-time data monitoring, and to build custom interfaces to external devices and software. The company holds a wealth of knowledge in the area of instrumentation applications and laboratory integration and has extensive experience working with large instrumentation companies.
